

Smart Scale for **Livestock**

Key data for Smart decision-making

System installation: scale and electronic ear tags

The low-cost ear tags placed on the animals are fitted with RFID sensors that identify each animal and its lot. They will report how long the animal has been drinking and the amount of water they have ingested.

In this way, the progress of the weight of each animal and its Flock can be closely monitored, which allows more equitable lots to be made in order to establish a better selling price.

Weight

Control the evolution of the weight of each individual animal or flock on a daily basis, as well as water intake and the number of times they drink.

Alerts

You will receive alerts on both the status of the animals as well as on the scale itself. Alerts for animals that are not fattening, not drinking water or do not reach a certain weight.

Profitability

It allows to optimise the resources of the feedlot by advising on specific recommendations when calves do not fatten and improves sales profit.

Health

Stay calm and safe by setting early alerts on the health status of the animals so that you can monitor and make decisions.

Control for **your farm**

More than 1.500.000 data collected

At Digitanimal we continue to collect data to bring you the most accurate smart scale on the market.

Collaboration with leading cooperatives

During the development of our smart animal scales, we have teamed up with the most important cooperatives.
